Fulfillment SOP: pick, then ship

A paid order becomes a pick. You scan that pick on the handheld. Validating the pick creates the delivery. The label, the box, and the final Validate are done on the computer.

Picking is the mobile barcode app. Everything after that is the desktop delivery order (`WH/OUT`).

Pick up in store is the same pick. When the customer has the order, **Validate** the delivery and stop. There is no label.

The red box in each picture is the control that step is talking about.

1. What you are looking at

Confirming a sales order does not print a label. It creates a **pick** named `WH/PICK/…`. That pick moves the units from stock onto the packing table (`WH/Stock` → `WH/Output`). The customer shipment, `WH/OUT/…`, is created when that pick is validated.

If the customer asked to ship what is in stock now and the rest when Victron stock arrives, there are two picks. Read the note on the pick:

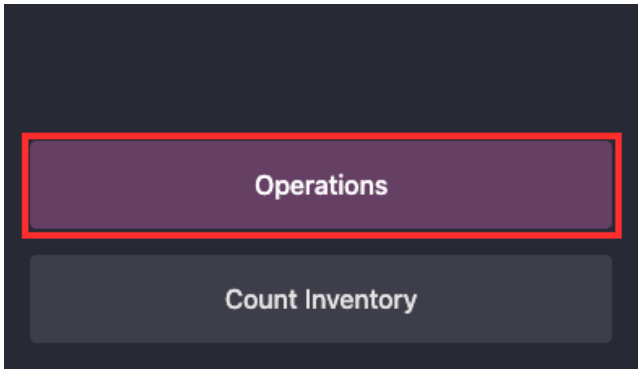

- **In stock now:** "Shipment of immediate stock. The rest will be fulfilled on WH/PICK/…."
- **Waiting on Victron:** "Stock to be sent from the Victron order. Purchase P… has been raised to fill this order."
- **Customer chose to wait:** one pick. "Customer has elected to wait for extra stock to arrive. Fulfil this order with stock from PO P…."

Pick the in-stock one now. Leave the Victron pick until that purchase order is received.

2. Pick on the scanner

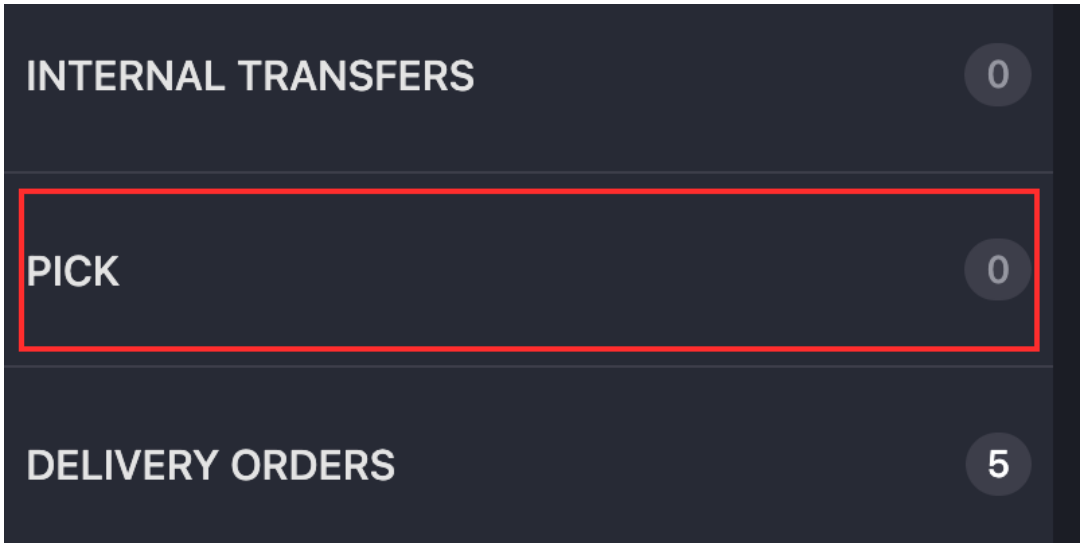

Open the Barcode app on the handheld. You do not start this from the sales order.

1. Tap **Operations**.

Barcode home. Operations is the purple button. Ignore Install and the push-notification warning.

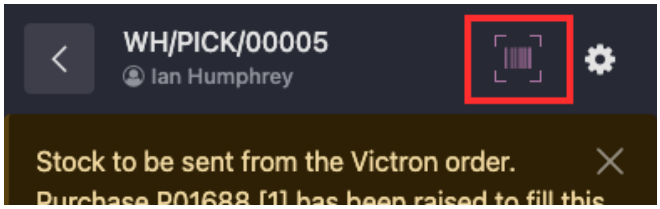

2. Tap **Pick**. The number is how many picks are Ready.

Pick is the row to open. Delivery Orders is not where you scan. A count of 0 means nothing is Ready.

3. Open the pick for this customer. You can also scan the pick's barcode to open it.

4. The top bar says **Scan a product**. On the handheld, press the button on the side of the scanner. The barcode icon in the corner is the on-screen camera, if the side button is not what you are using.

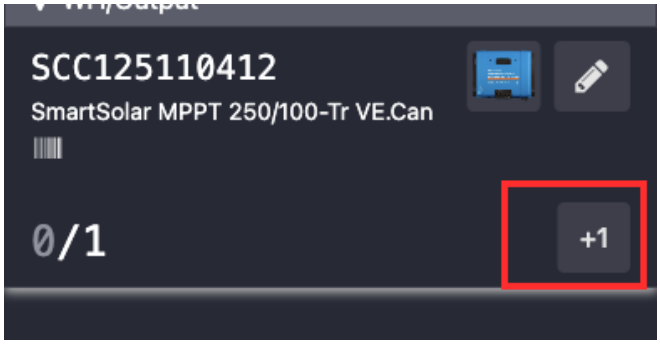

The barcode icon on a pick (WH/PICK/00005). The side button on the scanner is the hardware trigger. This icon is the on-screen one.

5. Scan the **serial number** on the unit. The serial is enough. The product is already known from it. If a GTIN and a serial are printed one above the other, cover the one you are not scanning.

6. The matching line highlights and asks for the serial if you scanned the product code first. Scan the serial second in that case.

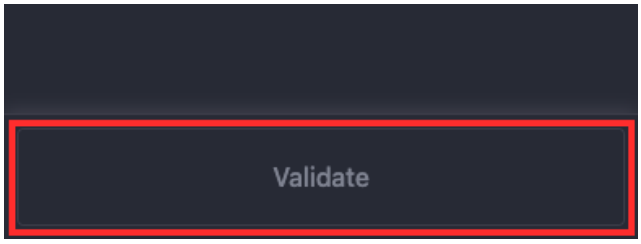

7. A wrong scan: tap the **minus** on that line, then scan the correct serial.

A scanner line. This one is still 0 of 1, so the only button showing is +1. Once a unit is scanned, the minus appears in that same corner and takes the scan off. Do not tap +1 to add a unit you did not scan. The line on a pick looks the same.

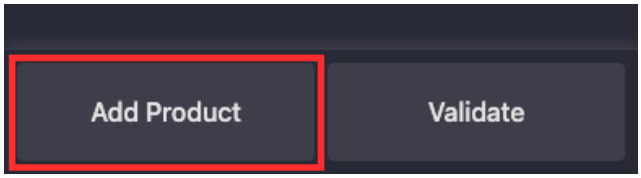

8. The line turns **green** when that product's quantity is filled. The prompt goes back to "Scan a product" for the next unit.

9. When every line is green, **Validate** turns purple. Tap it. That means the units are picked. It does not ship them and it does not print a label.

Validate on the pick. It stays grey until every line is green, then it turns purple. This pick is still waiting on Victron, so it is grey and there is nothing to scan.

Do not tap **Add Product**. If the scanner says the product is not reserved for this order, cancel that warning. Leave the unit in stock.

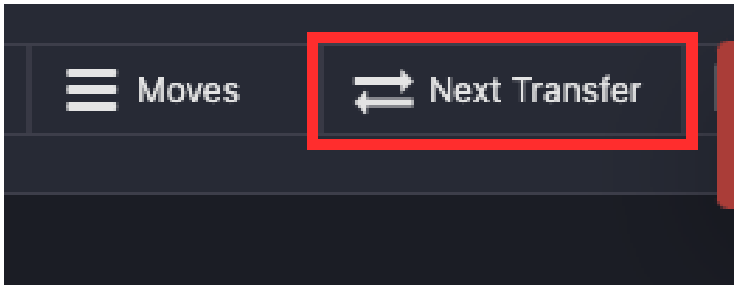

Add Product is on the scanner. Do not use it. It puts a product on the order the customer did not buy.

Do not validate a `WH/OUT` from the scanner. Scanning is only for the pick.

3. Find the delivery on the computer

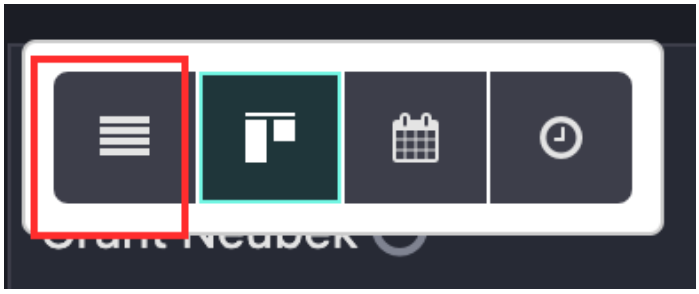

After the pick is validated, Odoo creates the delivery. You are still on that pick. **Next Transfer** opens the delivery.

Next Transfer on the finished pick (WH/PICK/00004). This is the first way onto the delivery.

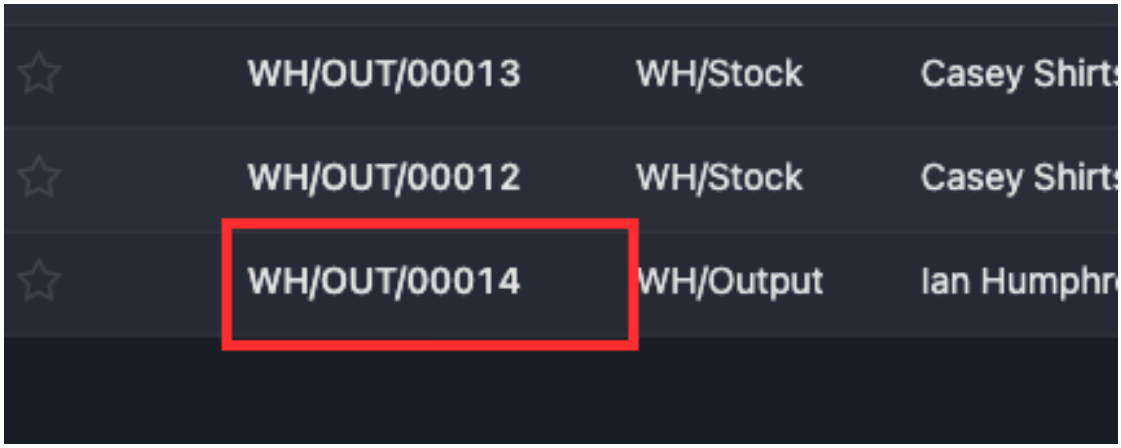

The other way is the deliveries list:

1. Open **Inventory → Operations → Transfers → Deliveries**.
2. If the screen is cards instead of a list, click the list icon (the one that looks like lines). It sits with the other view icons at the top right. On a narrow window those icons collapse into a small menu in that same spot.

The list icon. The highlighted card icon next to it is the kanban view Deliveries opens in.

3. Open the new `WH/OUT` for the same sales order. A shipment that has been picked shows **From WH/Output** and status **Ready**. Older one-step deliveries show From WH/Stock. The Source Document is the sales order number.

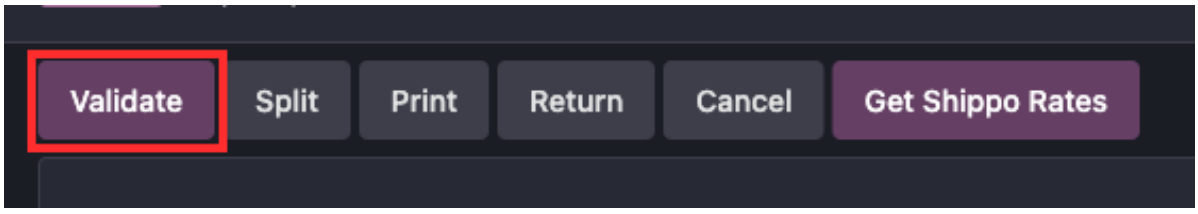

WH/OUT/00014, From WH/Output, customer Ian Humphrey, sales order S00008, status Ready. Click the reference.

4. In-store pickup

If **Carrier** on the delivery says **Pick up in store**, the customer collects the order at the shop. There is no label and no box to ship. The delivery address reads **In-Store Pickup**.

1. Pick it the same way. Scan every serial, then **Validate** the pick.
2. Open the delivery with **Next Transfer**, or from Deliveries.
3. When the customer has the order, click **Validate**. That is the only click on this delivery. Do not set a box, do not click **Get Shippo Rates**, and do not buy a label.

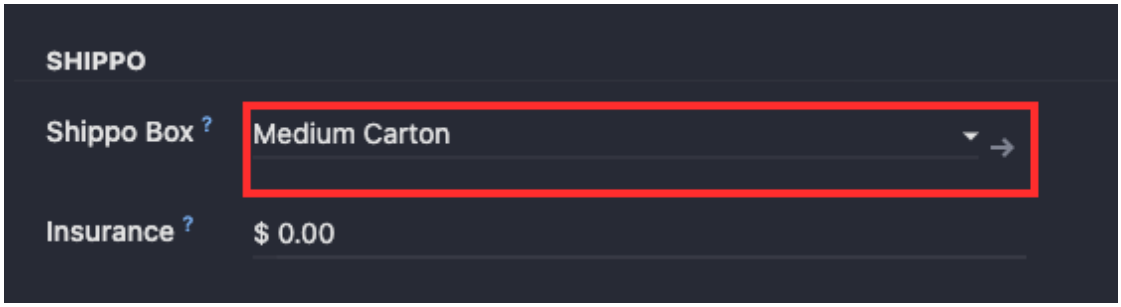

Validate on the delivery. For Pick up in store this is the only click, and only after the customer has the order.

If **Get Shippo Rates** is clicked on a pickup, Odoo asks: “This order has been marked as in-store pickup. Are you sure you want to print a shipping label?” Click **Cancel**.

5. On the delivery, in the order you click

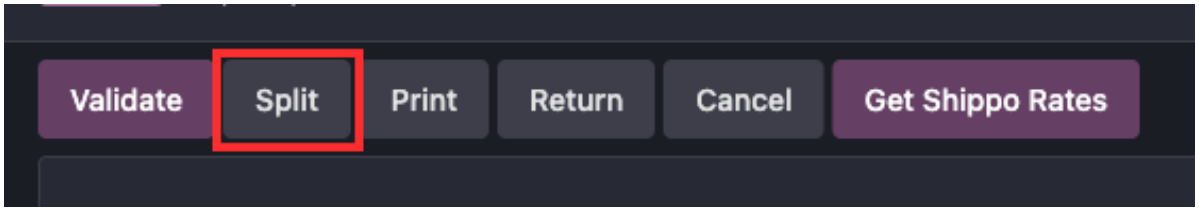

The product lines should already show the serials you scanned. Do these in this order. Split, when you need it, comes before the label. Validate is last.

1. In the **Shippo** section, set **Shippo Box** to the carton this box actually is. Leave insurance at $0 unless this shipment should be insured.

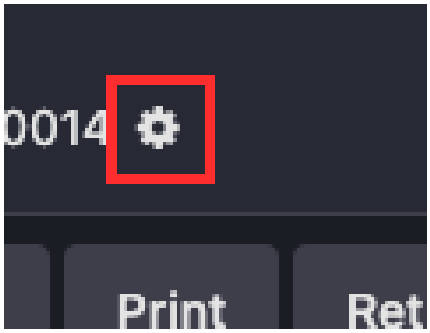

Shippo Box on WH/OUT/00014. This shipment is Medium Carton. Insurance stays at $0 unless this box should be insured.

2. If the order needs a second box, split now, before you buy a label. Click the header **Split**. Not the gear.

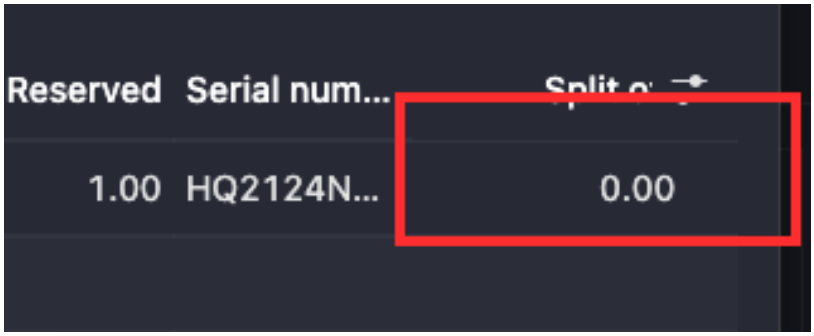

Header Split. This is the one that keeps serial numbers that were already picked. Do this before Get Shippo Rates.

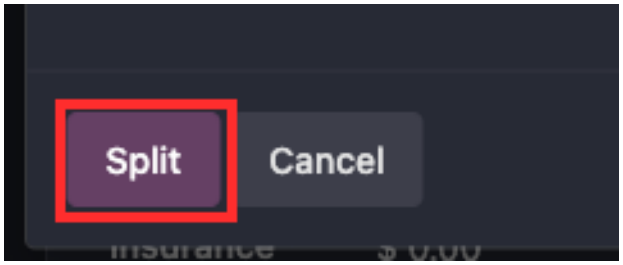

The gear, next to the delivery number. The Split inside this menu is a different command. Do not use that one.

3. For each product, type the quantity that goes in the next box in **Split off**. What you leave at 0.00 stays on this delivery. Serials already scanned stay on the units you leave here.

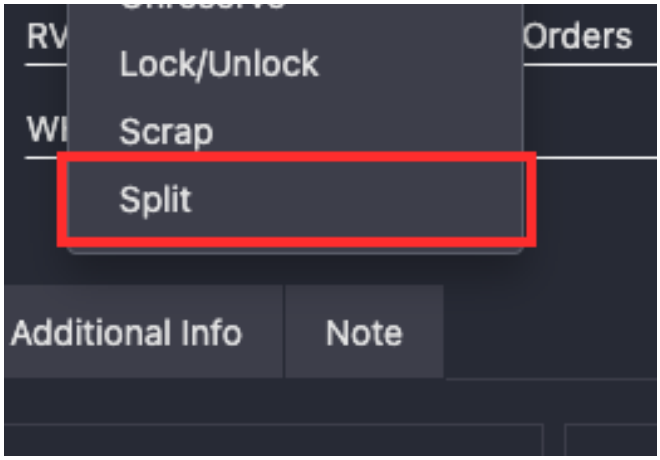

Split off is the 0.00 column. Type the quantity for the next box. Leave 0.00 on anything that stays in this box.

4. Click **Split** at the bottom of that window. Odoo creates the other delivery immediately. Buy the label and Validate this box first, then open the new delivery and do the same.

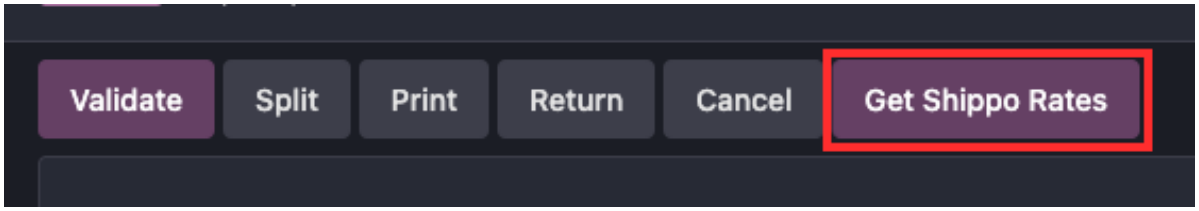

Split confirms the window. Cancel closes it and changes nothing.

The Split command in the gear menu keeps the quantity and drops the serials. Do not use it. Each delivery can send its own tracking email. That is two shipments of one order.

Split at the bottom of the gear menu. This is the one that drops serials.

5. Click **Get Shippo Rates**. The window shows the box, the weight, and the size. Change the box here if you picked the wrong one.

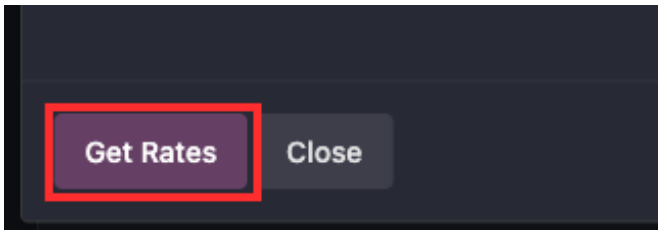

Get Shippo Rates. It does not buy anything.

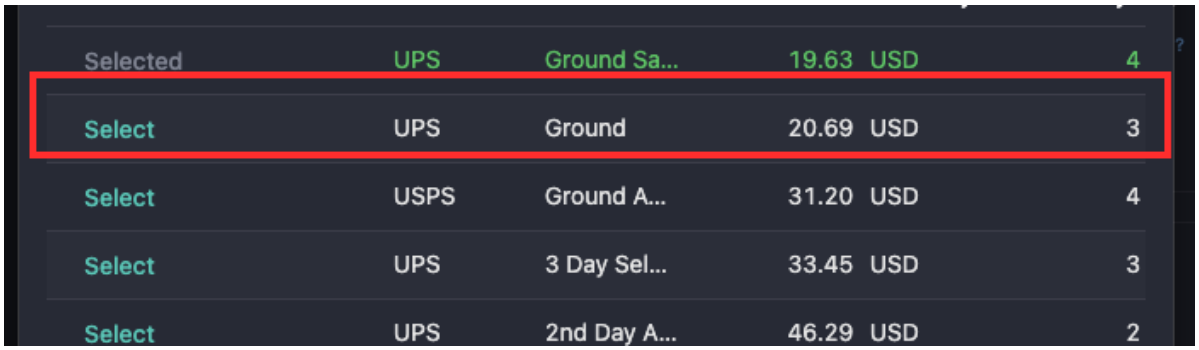

Inside that window, Box is the dropdown. Weight and the three size fields are filled from the carton you picked.

6. Click **Get Rates**. That lists prices. It does not charge the account.

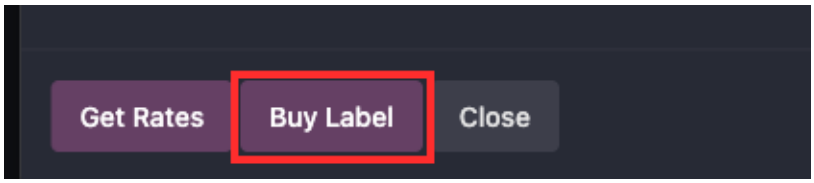

Get Rates. Close leaves without buying.

7. Click the service the customer paid for. Odoo may pre-select a cheaper service, such as Ground Saver. Change it to the one on the order, often UPS Ground. Then click **Buy Label**. Buying the label is the click that creates the charge.

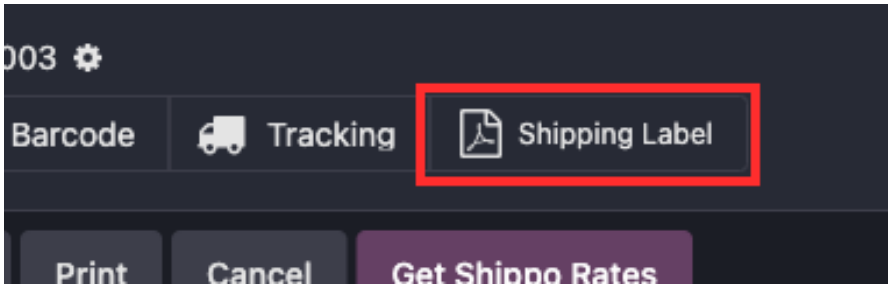

UPS Ground at $20.69. Ground Saver above it was already selected. Click Select on the service the customer paid for.

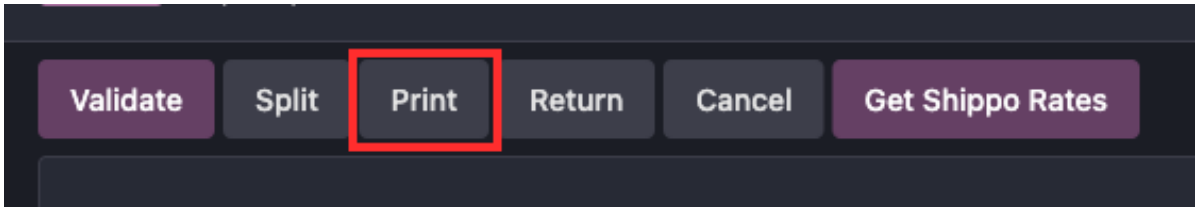

Buy Label charges the account. This picture was taken with the button in front of us. It was not clicked.

8. A new browser tab opens with the label, formatted 4×6 for the Zebra. Print that tab. If it never opens, or you need the file again, click **Shipping Label**. **Print** in the header is the delivery paperwork, not that label.

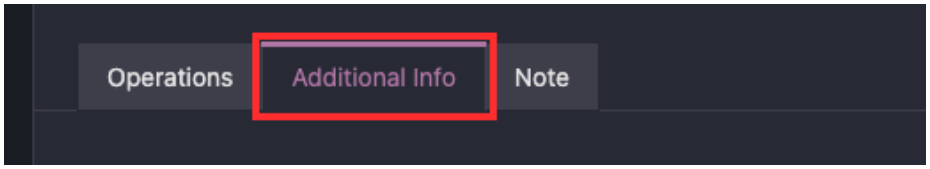

Shipping Label is the file you print. It only appears after a label has been bought. This one is WH/OUT/00003.

Print, in the header, is not the shipping label. Leave it unless you want the delivery documents.

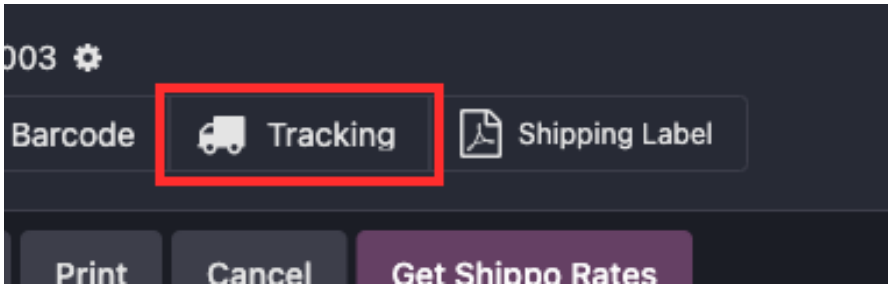

9. Open **Additional Info** and read **Tracking Reference**. It has to be the number you are about to stick on the carton. **Tracking** opens the carrier's page. That same link is what the customer gets. Shippo should not also email the customer.

Additional Info is the middle tab, between Operations and Note.

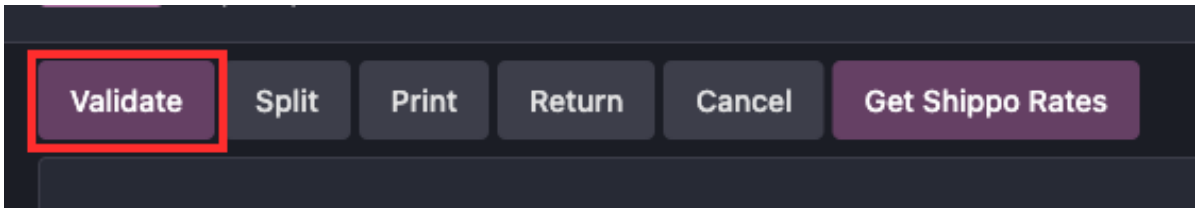

Tracking Reference. Check this before you validate. The number here has to match the carton.

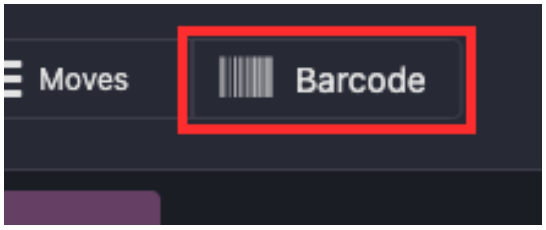

Tracking sits next to Shipping Label. It opens the carrier's page.

10. Put the label on that box. Then click **Validate**. Validate means it has left. That is what sends the customer the tracking email from Odoo.

Validate on the delivery. This is the last click.

The **Barcode** button on the delivery opens the scanner for that shipment. Do not scan or validate the delivery from there. Scanning is only for the pick.

Barcode on the delivery. Leave it.

6. Order of the buttons

Pick up in store stops earlier. Scan and **Validate** the pick. When the customer has the order, **Validate** the delivery. The steps below are for a shipment that leaves the building.

1. Scanner: scan every serial on the pick, then **Validate** the pick.
2. Computer: **Next Transfer** on that pick, or open the `WH/OUT` from Deliveries.
3. Choose the box. Split first if you need a second box.
4. **Get Shippo Rates → Get Rates → the paid service → Buy Label**.
5. Print from **Shipping Label** (or the tab that just opened). Check **Additional Info**.
6. Label on the box, then **Validate** the delivery.

Validating the delivery before the label is on the box marks it shipped with nothing to stick on the carton. If that happens, or if a scan, a split, or a label goes wrong, use the fixes below. Do not correct any of these with an inventory adjustment. An adjustment changes the quantity without a receipt or a delivery, and that throws off cost.

In-store pickup has no label. **Validate** that delivery only after the customer has the order.

7. Mistakes and how to fix them

Two barcodes got scanned as one

Victron labels sit on top of each other: the product code and the serial. The scanner takes whichever one the beam hits, and it will accept a part number as if it were a serial.

Cover the code you are not scanning. If the line already shows the wrong value, tap the **minus** on that line. The bad scan comes off. Scan the serial on the unit in your hand. The minus sits where **+1** is in the picture above, once the count is above zero.

The unit is not on this pick

The scanner says the product is not reserved for this order. It is in the system, and it is not this customer's.

Press **Cancel** on that warning. Leave the unit in stock. Do not tap **Add Product**.

The same serial is already in the system

A serial can belong to one unit. Scanning it again is rejected. That number is already on another record, often because the receipt stored the wrong code.

Do not ship the box under a serial that is not printed on it. Look the product up in **Inventory → Physical Inventory** and read the serial Odoo has in stock. Pick that unit, or stop and correct the receipt before this pick is validated. Do not type a new serial onto the pick to force a match.

The scanner asks for a source location, or for a signature

A pick does not need a location barcode, and it does not need a signature.

Back out of the pick. Don't scan a random barcode, and don't sign a name, to get past the prompt. Leave the pick unvalidated and have that prompt turned off. Then open the pick again.

There is nothing to pick

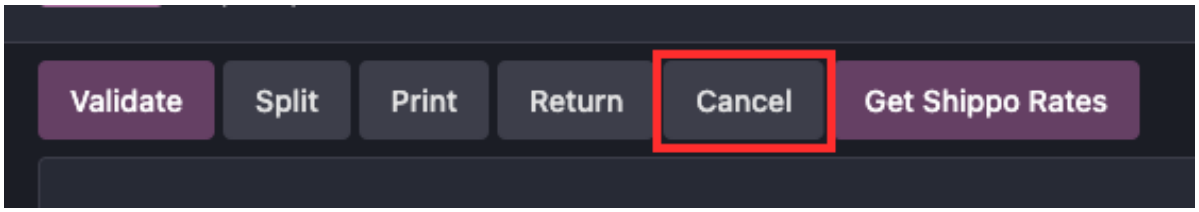

Operations shows **Pick 0**, the pick says it is already done, or the screen is only the note and a grey Validate, with no product lines. A Victron remainder looks like that until its purchase order is received. The banner names the purchase order.

Leave it. Receive that purchase order first. Don't validate an empty pick, and don't scan units onto a pick that is already done.

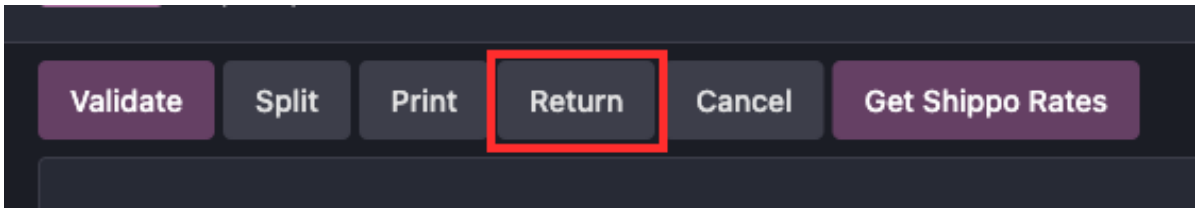

Validate was pressed on the pick too early

The lines were not all the right units, but Validate was purple and it got tapped. The units are now on the packing table and a `WH/OUT` exists. Nothing has shipped, and no customer email has gone out.

Do not buy a label, and do not Validate the delivery. Click **Cancel** on that delivery first, so the serials are no longer reserved on it. The units are still on the packing table. Open the finished pick and click **Return**. Validate the return. That moves them from the packing table back to stock.

Cancel on the delivery. Use this before a label is bought, when the pick was validated too early. It does not delete the sales order.

Return on the delivery, or on the finished pick. It creates the reverse transfer. The quantity does not move until that new transfer is validated.

Don't start another pick until the sales order has an open delivery again. If cancelling the delivery left the order with no shipment, leave the units in stock and flag the sales order. Don't put them back with an inventory adjustment.

The delivery was validated before the label was on the box

Pick up in store is not this case. That delivery has no label. **Validate** it when the customer has the order.

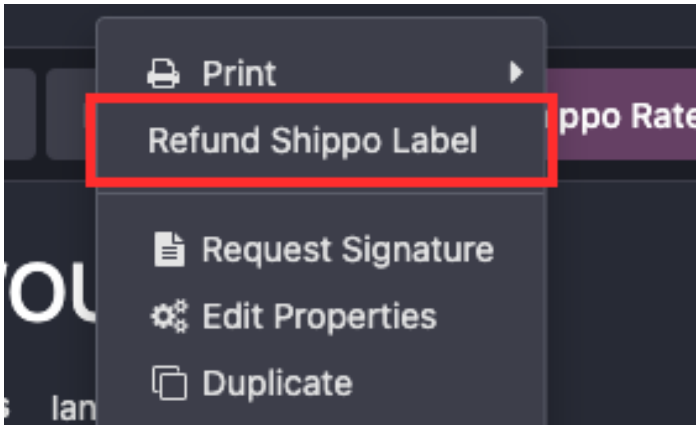

Validate on the computer means it has shipped. The customer email goes out. The label file is still on the delivery.

If the label was already bought, open it with **Shipping Label**, print it, and put it on the box before the carrier scans the package. If no label was bought, click **Return** on that delivery. Returning a delivery creates a receipt back into stock. Validate the receipt. The shipment is undone and the units are back. Then pick and ship again. The customer may already have the shipped email. Don't adjust the quantity by hand to "put it back."

The wrong service, the wrong box, or a label you are not going to use

Get Rates does not charge. **Buy Label** does. The charge is for the label, not for the carrier pickup. A label the carrier never scans can be voided.

On the delivery, open the gear and click **Refund Shippo Label**. The tracking number comes off the delivery, and the chatter says not to use that label. Tear it up. Shippo confirms the refund afterward. It is not instant. The gear item will refuse a second refund while one is already queued, pending, or successful.

Refund Shippo Label is in the gear menu, and only on a delivery that still has a label. Do not confirm it unless that label is unused. This picture stops at the menu.

If the carrier has already scanned the package, the refund is refused. The shipment stands. Don't buy another label for the same box.

A missing or invalid phone number makes Shippo refuse the purchase. Put a phone on the warehouse contact and on the delivery contact, click **Get Rates** again, and buy once.

Buy Label was clicked twice, or the print tab never opened

The label opens in a new browser tab, 4×6. If that tab didn't appear, or the Zebra is down, click **Shipping Label** on the delivery. That opens the same file. Print to PDF and use another 4×6 printer if you have to.

Don't click **Buy Label** again to "get the tab back." A second click purchases another label and replaces the tracking number on the delivery. The first label is still a real charge. The gear refund voids only the label currently stored on the delivery. The earlier tracking number is in the chatter, on the "Shippo label purchased" note. Don't put that label on a box. Give that tracking number to whoever runs the Shippo account so it can be voided there.

Split was done with the gear menu

The Split command in the gear menu keeps the quantity and drops the serials that were already picked. The header **Split** button is the one that keeps them.

If the gear split already ran, open both deliveries before you buy a label or validate. The serials that survived are on one of them. The other has quantities and blank serials. Scan those serials onto that delivery, the same way you pick, and confirm each line shows the serial printed on the unit. Then buy the label.

The header Split refuses, or the quantities are wrong

The header Split only runs on a delivery that is still open. It tells you which of these it is:

- **This delivery already has a tracking number.** Refund that label first. Splitting is allowed once the tracking number is gone.
- **This delivery can no longer be split.** It is done or cancelled. A shipped box is a new shipment, not a split of this one.
- **Leave at least one unit on this delivery.** Split off is the quantity for the next box. Leave the rest at zero so it stays here.
- **You can split at most…** The number is larger than what this delivery still has.

If the split amounts are wrong and neither delivery has a label and neither is validated, don't ship them that way. Split again so each delivery matches the units actually in that box. Splitting never merges two deliveries back into one, and cancelling the new delivery does not put those units back on the first. Leave both open until each one shows the serials that are physically in its box.

The customer got two tracking emails, or an email with no tracking

Two boxes are two deliveries, so two emails is the normal result. Each email should be the tracking number on that box.

An email with a blank tracking number means Validate happened with no label on the delivery, or the label was refunded and the tracking field was cleared. Don't send the template again until **Additional Info** shows the tracking number that is on the carton. The tracking button on the delivery should open the carrier's page in one click. That is the same link the customer gets. Shippo should not send its own email.

Still to write: returns

The returns walkthrough is not in this SOP yet. The rule, so it is not done as an inventory adjustment: on a receipt or a delivery, click **Return**. Returning a receipt creates an outgoing transfer back to the vendor. Returning a delivery creates a receipt back into stock. Open that new transfer and **Validate** it. Until it is validated, the quantity has not moved. A manual quantity change is what throws off cost, because it is not tied to a receipt or a delivery.
